PROFESSIONAL SUMMARY

Game Programmer with hands-on experience building 2D and 3D games in Unreal Engine 5. Skilled in C++, Blueprint Visual Scripting, AI systems, and gameplay programming. Focused on writing clean, modular code and building responsive, engaging player experiences.

EDUCATION

RD & SH National College and SWA Science College **2024**
Bachelor of Science in Computer Science CGPA: 7.89

JJ Academy **2021**
HSC 80%

SKILLS

Programming Languages: C++, Python, C#
Game Development: Unreal Engine 5, Unity, Blueprint Visual Scripting
UE5 Systems: Enhanced Input System, Animation Montages, PawnSensing, Motion Warping, Behavior Trees
Core Concepts: AI State Machines, Component Architecture, Gameplay Programming, Collision Handling, Debugging
Tools: Visual Studio 2022, Git, GitHub

PROJECTS

Monster Hunter – 3D Action Game | Unreal Engine 5, C++ **Jan 2026 – Present**
github.com/bechulal/MonsterHunter · bechulal.github.io

- Built a 3D third-person action game in C++ where a monster huntress earns coins by defeating diverse enemy types across the world.
- Engineered a full Enemy AI state machine in C++ with Patrol, Chase, Attack, Engaged, and Dead states, each with distinct logic and movement speeds.
- Implemented PawnSensing-based player detection with configurable sight radius and peripheral vision angle, triggering dynamic pursuit.
- Developed directional hit reactions using dot product and cross product math to detect whether a hit came from front, back, left, or right.
- Integrated Motion Warping so attack animations smoothly reposition the character relative to the combat target.
- Used UE5's Enhanced Input System for all player controls, with a custom action state machine preventing conflicts between attacking, dodging, equipping, and hit reactions.
- Built a stamina system that regenerates per tick and is consumed by dodge rolls, with real-time HUD feedback via a custom SlashOverlay widget.
- Designed weapon socket attachment system with hand and back sockets driven by animation montage equip/unequip events.
- Structured all health, stamina, gold, and soul tracking through a shared custom AttributeComponent for clean, reusable architecture.

Kill The Hero – 2D Action Platformer | Unreal Engine 5, Blueprints **Nov 2025 – Jan 2026**
github.com/bechulal/KillTheHero · bechulal.github.io

- Developed a 2D action platformer in Unreal Engine 5 using Blueprint Visual Scripting exclusively — no C++.
- Implemented player movement, combat mechanics, collision handling, and a dialogue system entirely through UE5's node-based Blueprint system.
- Built enemy AI using Behavior Trees and Blackboards for player detection, pursuit, and attack logic.
- Integrated 2D flipbook animations using Paper2D/PaperZD and debugged gameplay issues to improve stability.
- This project was my introduction to Unreal Engine and laid the foundation for transitioning into C++-driven development.

CERTIFICATIONS

Game Programming in Unreal Engine – Gamer2Maker **Oct 2025**

HOBBIES

I enjoy reading books related to game development and software craftsmanship. Currently exploring:

- Blood, Sweat, and Pixels – Jason Schreier
- Game Programming Patterns – Robert Nystrom (Currently Reading)
